Sequence 18, Application US/0990903
Patent No. US20020052031A1
GENERAL INFORMATION:
APPLICANT: Waterman, Michael R.
APPLICANT: Hellamine, Aouatef
TITLE OF INVENTION: Mycobacterium tuberculosis CYP51 POLYPEPTIDES AND
TITLE OF INVENTION: MYCOBACTERIUM THERAPEUTIC AND SCREENING METHODS
TITLE OF INVENTION: RELATING TO SAME
TITLE OF INVENTION: RELATING TO SAME
FILE REFERENCE: Attorney Docket No. US20020052031A1 1242-17
CURRENT APPLICATION NUMBER: US/09/909,903
CURRENT FILING DATE: 2001-07-20
NUMBER OF SEQ ID NOS: 21
SOFTWARE: Patentin Ver. 2.1
SEQ ID NO 18
LENGTH: 503

Acts on retinoids, including all-trans-retinoic acid (RA) and its stereolsomer 9-c1s-RA. Capable of both 4-hydroxylation and 18-hydroxylation. Responsible for generation of several hydroxylated forms of RA, including 4-OH-RA, 4-oxo-RA, AND 18-OH-RA. SUBCELLULAR LOCATION: Membrane-bound. Endoplasmic reticulum. INDUCTION: BY RETINOIC ACID.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               European Bioinformatics Institute.

-!- FUNCTION: Plays a key role in retinoic acid metabolism. Appears be involved in the specific inactivation of all-trans-RA.

Responsible for generation of several hydroxylated forms of RA, including 4-OH-RA, 4-OXO-RA, and 18-OH-RA.

-!- SUBCELLULAR LOCATION: Membrane-bound. Endoplasmic reticulum.

-!- DEVELOPMENTAL STAGE: EXpressed at stage 4 in the ectoderm, stage 5-7 in the nascent notochord and at stage 7 its expression decreases in the anterior part of the embryo. From stage 7-10 it expression is restricted to the dorsal folds of the neural tube.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     "Complementary domains of retinoic acid production and degradation the early chick embryo."; Dev. Biol. 216:282-296(1999).
